ACCESSION NR: AR5008606

of frequencies the circuit includes a RC frequency divider of the integral type; the signal from this divider is used to control the regulating device. The total error of the apparatus is 7%. When an oscillating frequency generator is used the process of determining the characteristics can be fully automated. If the internal generator of a frequency characteristic spectrum analyzer is used as an oscillating frequency generator by feeding a signal from the converter to the input of the analyzer, it is possible to observe the entire amplitude-frequency characteristic of the converter on the screen of a cathode-ray tube. M. Mekler.

TITLE: The suppression of pulsed perturbations by means of a subtraction circuit

SOURCE: AN UkrSSR. Elementy sistem otdora i peredachi informatsii (Elements of systems for selecting and transferring information). Kiev, Naukova dumka. 1965, 168-171

TOPIC TAGS: signal noise separation, logic circuit, signal interference, electronic circuit, circuit design

ABSTRACT: Various band, blocking, and other filters made of LC or RC elements for the separation of the useful signal from a background of strong harmonic noise can be utilized with success only if the perturbation has a continuous character. The author gives a description of difficulties encountered with pulsed perturbations, and presents a brief description of the design and operation of the circuit, shown in Fig. 1, capable of separating out brief signals from the background of pulsed perturbations exceeding the useful signal by 70 to 80 dB. The use of a subtraction circuit in conjunction with a low Q-factor RC filter results in a quality signal filtration in the presence of sharp radiopulse perturbations. Orig. art. has: 2 formulas and 1 figure.

Orig Pub: Studii si cercetari stiint Acad RPR. Baza Timisoara. Ser. stiinte chim., 1956, 3, No 3-4, 67-73.

Abstract: The volatility of aqueous solutions of boric acid was determined under the general pressure of 750, 600, 450 and 300 mm of mercury column. The results were adjusted using Raoult's (sic!) [probably Raoult's law] law. The obtained results indicate that boric acid is little volatile and that its volatility depends directly on the concentration up to the mean content of 25% by weight. Volatility rises little at high concentrations. It is emphasized that the greater results of other authors have been caused by the fact that boric acid volatilize easily at boiling.

TITLE: Kinetics of formation and decomposition of solid solutions in refractory carbide systems

SOURCE: M. SSSR. Otdoloniye obshchey i tekhnicheskoy khimii. Issledovaniya v oblasti khimi i silikatov i okislov (Studies in the field of chemistry of silicates and oxides). Moscow, Izd-vo Nauka, 1965, 250-256

TOPIC THIS: solid solution, decomposition, zirconium carbide, niobium compound, zirconium compound

ABSTRACT: The formation of solid solutions in ZrC-NbC and TiC-NbC systems was studied as a function of temperature and duration of the synthesis process. The products were analyzed by x-ray, metallographic and chemical methods. In both systems, the matrix of the solid solution is NbC, whose lattice can increase in volume without breaking its chemical bonds. As the holding time increases, a gradual decomposition of the solid solutions takes place. Concentration-time curves for solid solutions at various synthesis temperatures showed that the formation of solid solutions is faster and their decomposition slower the higher has been the synthesis temperature. The data obtained permit one to calculate the time required for the maximum solubility of TiC

Card 1/2

L 08447-67

ABSTRACT: Solid-state chemical reactions in the TiC-ZrO ₂ system have been studied within the 1700-2400 K range in vacuum. Correlation of experimental data with thermodynamic analysis data indicated that only three reactions occur in the system within the temperature range studied. The direction of the chemical process and predominance of one or another of the three reactions depend on temperature, gaseous atmosphere composition, and the ratio of components in the starting mixture. Orig. art. has: [JK] 4 figures, 3 tables, and 13 equations.

TITLE: Use of a ^{b1}cermet made of tungsten and aluminum oxide in the preparation of cathodic heaters of electron tubes

SOURCE: AN SSSR. Otdeleniye obshchey i tekhnicheskoy khimii. Issledovaniya v oblasti khimi i silikatov i okislov (Studies in the field of chemistry of silicates and oxides). Moscow, Izd-vo Nauka, 1965, 257-264

TOPIC TAGS: high temperature cermets material, tungsten, aluminum oxide

ABSTRACT: The aims of the study included (1) the selection of W-Al₂O₃ cermets compositions suitable for the preparation of cathodic heaters, (2) a study of their physical properties (resistivity as a function of temperature, emissivity, strength, porosity, etc.) as functions of the composition and processing. The influence of the regularity of distribution of the metal (tungsten) and oxide (α -Al₂O₃) particles and degree of dispersion of the starting materials on the properties of the sintered cermets was determined. The sintering was found to worsen with rising tungsten content; the shrinkage and relative density decrease, and the porosity increases. The mechanical and elastic properties are determined by the porosity. The optimum combination of

Cord 1/2

L 08101-67

TITLE: Manufacture of Disks on Cermet Bonding for the Dressing of Abrasive Tools

PERIODICAL: Tr. Leningr. tekhnol. in-ta im. Lensoveta, 1959, No. 57, pp. 103-104

TEXT: Disks for the straightening of abrasive tools are made on brass bonding and have a series of deficiencies. The authors studied the effect of the composition of the ZrO₂ base cermet bonding on the strength and quality of WC disks. An X-ray analysis did not reveal any structural changes in WC grains after roasting. Zones with a higher content of metal from the cermet bonding formed around the WC grains; this promoted the strong fixing of these grains in the bonding. After roasting at 1,700°C, cracks were detected on the lateral surfaces of the disks and the hardness of grains on the surface was somewhat reduced. Apparently, the changes in the hardness of the grains were connected

TITLE: Effect of powder fineness on the density of niobium carbide parts at various sintering temperatures

SOURCE: Poroshkovaya metallurgiya, no. 6, 1963, 11-17

TOPIC TAGS: niobium carbide, sintered niobium carbide, niobium carbide powder, niobium carbide sintering, niobium carbide density, sintering, powder metallurgy, density

ABSTRACT: Niobium carbide sinters poorly due to its high melting point (3750 K), leading to lower microhardness. The present authors therefore studied the relationship between particle size, sintering temperature, density and heat resistance of NbC and attempted to find methods for producing niobium carbide powder with a relative density not lower than 90% of the theoretical value at low sintering temperatures. This is very important for creating heat resistant structures. Pulverization in vibro-mills was used to obtain fine particles of niobium carbide, thus increasing the surface energy prior to cold pressing. Fig. 1 in the Enclosure shows the effect of the sintering temperature on the specific gravity of niobium carbide

Card 1/4

ACCESSION NR: AP4005835

with varying initial specific surface area. This test was performed on the Deryagin device. As seen from the graph in Fig. 2 of the Enclosure, greater dispersion of the powder leads to higher density at lower temperatures. Two formulas are proposed by the authors for relating the sintering temperature and fineness of the carbide powder. Experimental data and the theoretical values obtained from these formulas differed by not over 1-1.5%. Tests performed by the authors also corroborated the phenomenologic theory mentioned in articles by M. S. Koval'chenko, G. V. Samsonov and V. V. Skorokhod. It was found that a relative density of niobium carbide powder of up to 97% can only be obtained with very fine powder and sintering temperatures \leq 0.6 m.p. On the basis of experimental data, the lattice destruction energy for NbC is calculated to be approximately 410 k-j/mol. Orig. art. has: 7 figures, 4 tables and 9 equations.

TITLE: Interaction of certain refractory carbides with zirconium
oxide

SOURCE: Ogneupory, no. 12, 1964, 570-575

TOPIC TAGS: refractory carbide, refractory oxide, zirconium carbide,
titanium carbide, zirconium dioxide, high temperature refractory,
cermet component, refractory ceramic, niobium carbide

ABSTRACT: Physical, mechanical, and electric properties and the
crystal lattice structure of the refractory sintered mixtures of zir-
conium dioxide with zirconium, titanium, or niobium carbides have
been investigated. The investigation follows up a series of publica-
tions on interaction between refractory carbides and oxides. The im-
portance of the subject was stressed for high-temperature applications.
Compacted samples of the carbide-zirconium dioxide mixtures containing
5-95% of each component were vacuum sintered at 2300-2400C. Pure

zirconia, either unstabilized (monoclinic) or stabilized by fusion or by the addition of CaO, was used as starting material. Measurements of the physical and mechanical characteristics of the sintered samples and the kinetics of the changes in combined carbon content of the mixtures at various temperatures during the sintering indicated that ZrC-ZrO₂ "cermets" are the most stable of the materials investigated at high temperature. X-ray investigation of the lattice parameters showed the effect of ZrO₂ content and form in the samples. Lattice parameters of the carbide component decrease with increasing ZrO₂ concentration; this decrease is most pronounced for the ZrO₂ stabilized by fusion, and least pronounced for the monoclinic ZrO₂. The pattern of the changes in lattice parameters confirmed the stability of the ZrC-ZrO₂ and TiC-ZrO₂ "cermets" at sufficiently high temperature. Micrographs of the sintered samples produced the evidence of the existence of a third phase which was metallic. The properties of ZrC-ZrO₂ and TiC-ZrO₂ "cermets" make them potential construction materials for high-temperature use. Orig. art. has: 4 figures and 5 tables.

TITLE: Some characteristics of styrene-divinylbenzene copolymers and cationites of the Vionit[®] CS-2 type with various degrees of cross-linking

SOURCE: Revista de chimie, v. 17, no. 2, 1966, 78-80

TOPIC TAGS: copolymer, styrene, vinyl compound, polymer cross linking

ABSTRACT: A report on the relation of various properties of styrene-divinylbenzene copolymers and CS-2 Vionit type cationites to the divinylbenzene content. Variation of swelling coefficient with degree of cross-linking, and effect of changes in temperature, particle size, solvent, etc. were determined experimentally, and the divinyl-benzene content was expressed as a function of the corresponding swelling coefficient. Biological Chemistry

Characteristics of saltlike compounds of deoxyribonucleic acid with proteins. O. P. Chepinoga and R. Sh. Groblast. Inst. Biochem., Acad. Sci. Ukr. R. S. R. (Kiev). Zhur. Biokhim. Zhur. 21, 121-38 (in Russian, 138-40) (1949).—A protein soln. of fixed concn. (0.5 ml.) was added to 1 ml. of a soln. of deoxyribonucleic acid (DNA) or of its Na salt (DNNa), resp. The excess of protein was removed with pionic acid. A certain percentage of the protein enters in a saltlike combination with DNA. The proteins investigated were egg albumin, histone, fibrinogen, casein, dephosphorylated casein, myosin fractions, myogen B, and actin. The animal proteins were obtained from dog and rabbit tissues, from kidneys, liver, and spleen. The percentage of combined DNA or DNNa is greatly influenced by the pH and the amounts of NaCl, NH₄Cl, Na₂HPO₄, or KCl present. It is also of importance whether the protein is undenatured or denatured, and here too there is a difference whether denaturation was brought about by heat or by an excess of urea. This reaction is deemed significant because it is believed that the action of viruses may proceed in a similar way. The presence of adenosinetriphosphate, adenylic acid, and of the Carty depolymerase (Avery, *et al.*, C.A. 38, 1841*) gives rise to a competitive inhibition of the reaction. W. J.

The effect of tuberculoses of bone joints on the composition of the phosphorus compounds of muscle, blood, and bone of rabbits. R. B. Groszilat and B. S. Kutsenok (Transcarpathian Sci. Research Inst. Protection Mother and Child, Mukachevo). *Ukrain. Biokhim. Zemlja*, 28, 459-61 (Russian summary, 403) (1955).—The bone joints of rabbits were infected with a tuberculous culture. The inflammatory processes in the bones and in the joints appear 1.5-2 months after the inoculation. In the development of the tuberculous bone processes the following changes occurred in the compus. of the neighboring skeletal muscle: the P of the adenosinetriphosphate was reduced by 24-42%; creatine was reduced by 29-39%; inorg. P was increased on an av. of 25-65%; inorg. P appeared in the blood to a greater extent and the alk. phosphatase activity increased. The latter was also increased in the bone tissue of infected rabbits. Histologic studies confirmed the macro-observations.

On the Convergence of the Method of Nets for the Solution of Dirichlet's
Problem of Heat Conduction

Groschalová, Zdenka. Über die Konvergenz der Netz-
methode für die Lösung des Dirichletschen Problems und
der Wärmeleitungsgleichung. Apl. Mat. 2 (1957), 342-
360. (Czech, Russian and German summaries)

1-2
1-FW

Es handelt sich um numerische Behandlungsmethoden
zur Lösung der partiellen Differentialgleichungen 16

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0 \text{ bzw. } \frac{\partial^2 u}{\partial x^2} = \frac{\partial u}{\partial t}$$

mit den Randbedingungen

$$\left. \begin{array}{l} u(0, y) = \varphi_1(y) \\ u(x, 0) = F_1(x) \\ u(a, y) = \varphi_2(y) \\ u(x, b) = F_2(x) \end{array} \right\} \text{ bzw. } \left. \begin{array}{l} u(x, 0) = f(x) \\ f(0) = f(a) = 0 \\ u(0, t) = 0 \\ u(a, t) = 0 \end{array} \right\}$$

für $0 \leq x \leq a$, $0 \leq y \leq b$ bzw. $0 \leq x \leq a$, $0 \leq t \leq \infty$. Die Verfas-
serin gewinnt hinreichende Bedingungen für die maximale
Schnelligkeit der Konvergenz der sogenannten Netz-
methoden. Ist h die Größe der gewählten Netzmache und
sind im Falle des Dirichletschen Problems der Laplace-
schen Gleichung die Randfunktionen in allen Ecken des
Rechtecks stetig, so gilt: im vorgegebenen Rechteck
konvergiert die Netzlösung der Laplaceschen Gleichung
gegen die genaue Lösung genau so wie h^2 , wenn die erster

11

12

Großartig! 2 denk.

Ableitungen der Randfunktionen eine beschränkte Schwankung haben. Diese Konvergenz ist auf dem geschlossenen Rechteck gleichmäßig, wenn die zweiten Ableitungen der Randfunktionen eine beschränkte Schwankung haben. Im Falle der Wärmeleitungsgleichung gesellt sich zum räumlichen Intervall h der Netzmethode das Zeitintervall τ ($\tau/h^2 = \beta$). Dann gilt: für alle festen t , $0 < t < \infty$ konvergiert die Netzlösung gegen die genaue Lösung genau so wie h^2 unter der Voraussetzung, daß die erste Ableitung der Anfangsfunktion eine beschränkte Schwankung hat. Sie konvergiert wie h^4 unter der Bedingung, daß die dritte Ableitung dieser Funktion eine beschränkte Schwankung hat und $\beta = 1/6$ ist. Wenn die zweite Ableitung der Anfangsfunktion eine beschränkte Schwankung hat, konvergiert die Netzlösung gegen die genaue Lösung gleichmäßig für alle t , $0 \leq t \leq T < \infty$, wie h^6 . Wenn die vierte Ableitung dieser Funktion eine beschränkte Schwankung hat, $\beta = 1/6$ ist und die zweite Ableitung der Anfangsfunktion in ihren beiden Endpunkten verschwindet, ist die Konvergenz von der Ordnung h^4 .
